

Product Highlights

Spherical Plain BEARINGS

Bearings Limited carries a comprehensive selection of Spherical Plain Bearings.

Spherical Plain Bearings are produced in many designs and with various combinations of sliding contact surfaces. The basic design is composed of a fractured outer ring of carbon chromium steel which is hardened & phosphated; and an inner ring of the same material. On both, the sliding surfaces are treated with Molybdenum Disulfide (MOS₂) to reduce friction. Most designs can be re-lubricated through annular grooves and lubrication holes in the rings. Many designs are also available with a PTFE Composite lined sliding surface, offering a maintenance free solution with lower friction.

Bearings Limited carries a high quality bearing produced by one of the oldest and most well established factories in China. These bearings are produced under the strict ISO9000 guidelines for which they have received certification since 1995. In recent years, they have produced bearings on consignment for some of the largest bearing manufacturers in Europe.
